

1. Create a Student Management System using Class and Object in Python.

What to Do

1. Create a class named Student.
2. Create a constructor `__init__()` to initialize:
 - Student name
 - Roll number
 - Age
 - Marks of 3 subjects
3. Create a `display_details()` method to display all student information.
4. Create a `calculate_total()` method to calculate the total marks.
5. Create a `calculate_percentage()` method to calculate the percentage.
6. Create a `check_result()` method:
 - Student passes if marks in every subject are **35 or above**.
 - Otherwise, display FAIL.
7. Create an `update_marks()` method to update the marks of a selected subject.

2. Create a Library Management System using Class and Object in Python.

What to Do

1. Create a class named Book.
2. Create a constructor `__init__()` to initialize:
 - Book name
 - Book ID
 - Author name
 - Availability status
3. Create a `display_book()` method to display book details.
4. Create a `issue_book()` method:
 - Check whether the book is available.

- If available, issue the book and change its status.
 - If already issued, display an appropriate message.
- 5. Create a return_book() method:
 - Return the issued book.
 - Change its availability status back to available.
- 6. Create a check_availability() method to display whether the book is available or issued.

3. Create a simple Employee Management System using Class and Object in Python.

What to Do

1. Create a class named Employee.
2. Create a constructor __init__() to initialize:
 - Employee name
 - Employee ID
 - Department
 - Basic salary
3. Create a display_details() method to display employee information.
4. Create a calculate_salary() method:
 - Add a fixed bonus of ₹5,000.
 - Calculate and display the final salary.
5. Create a check_salary() method:
 - If salary is ₹30,000 or above, display "Good Salary".
 - Otherwise, display "Average Salary".
6. Create a menu-driven program:
 - 1 → Display Details
 - 2 → Calculate Salary
 - 3 → Check Salary
 - 4 → Exit
