

❖ Functional Programming

1. Write a program using a lambda function to find the square of each number in a list using `map()`.
2. Write a program using a lambda function to convert all names in a list to uppercase using `map()`.
3. Write a program using `map()` to calculate a 10% discount on a list of product prices.
4. Write a program using `filter()` to extract all even numbers from a given list.
5. Write a program using `filter()` to display all students who scored 35 or more marks.
6. Write a program using `filter()` to remove all empty strings from a list.
7. Write a program using `map()` to find the length of each string in a list.
8. Write a program using `reduce()` to calculate the sum of all numbers in a list.
9. Given a list of employee salaries, use `map()` to increase each salary by 15%.
10. Given a list of integers, use `filter()` to display only the numbers that are divisible by both 3 and 5.
