

1. What is inheritance in Python?
2. Why do we use inheritance?
3. What are the advantages of inheritance?
4. What is a parent class and child class?
5. What is the difference between a parent class and child class?
6. How do you implement inheritance in Python?
7. What is the syntax for creating a child class?
8. What is code reusability, and how does inheritance provide it?
9. Can a child class access the methods and attributes of its parent class?
10. Can a parent class access the methods and attributes of its child class?
11. What happens when both parent and child classes have a constructor?
12. If the child class does not have a constructor, which constructor will be called?
13. If both parent and child have `__init__()`, how can you call the parent constructor?
14. What is `super()` in Python?
15. Why do we use `super()`?
16. How do you use `super()` to call a parent constructor?
17. What is method overriding?
18. Why is method overriding used?
19. What happens when a child class has a method with the same name as the parent class?
20. What are the different types of inheritance supported by Python?
21. What is single inheritance? Give an example.
22. What is multilevel inheritance? Give an example.
23. What is multiple inheritance? Give an example.
24. What is hierarchical inheritance? Give an example.
25. What are public, protected, and private members in Python?

26. Can a child class access a public member of its parent?
27. Can a child class access a protected member of its parent?
28. Can a child class directly access a private member of its parent?
29. What is name mangling in Python?
30. Why do we use private attributes with getter and setter methods?
31. What is a getter?
32. What is a setter?
33. Why do we use getter and setter methods?
34. Can a child class use the getter and setter methods of its parent?
